

Universal Temperature Probe MODEL EI-1034

Instruction Manual

Description

The EI-1034 is a universal temperature probe that consists of a silicon type temperature sensor mounted in a waterproof stainless steel tube. It uses the highest grade available of the LM34 sensor from National Semiconductor with a typical room temperature accuracy of $\pm 0.4^{\circ}\text{F}$ ($\pm 1.0^{\circ}\text{F}$ max). Because of the high-level linear voltage output and high accuracy, this probe is easier to use and superior to thermocouples, thermistors, or RTDs, for many applications in the range of 0 to 300 $^{\circ}\text{F}$ (temperature range varies with positive supply voltage, negative supply voltage, and LabJack model). The probe is suitable for air and liquid applications, and can be conveniently secured into pipes, vessels and chambers by using available $\frac{1}{4}$ inch compression fittings.

The EI-1034 is intended to be connected to a LabJack for 5-volt power but can be used as a stand-alone temperature sensor when connected to a DVM and a power supply in the range of 5 to 30 volts.

Electrical Connections

Three wires require connections; they are +5 volts (red), ground (black) and output (white). These wires can be connected to the appropriate terminal on the LabJack or other power supply in the case of using the sensor as a stand-alone unit. The output wire (white) will normally output a voltage of approximately 0.77 volts at room temperature.

Cable Length

The maximum cable length of the probe can be extended to 25 ft without serious degradation in performance. If the user desires to extend the length of the cable beyond 25 ft (up to 500 ft) then a resistor of 10K ohms should be inserted in series with the white wire. The resistor should be placed at the 5 ft length of the probe. When using a series resistor of 10K ohm the user should consider the voltage drop across the resistor when calculating the final temperature measurement.

Low Temperature Operation

The low temperature range of the EI-1034 can be extended to -50°F by adding a 100K resistor to an isolated negative supply voltage (typically -5 volts) as shown in Figure 1. A standard wall plug-in supply can be used in the range of 5 to 15 volts. A 9-volt battery is also a good source for a negative voltage. Care must be taken to connect the positive terminal of the isolated supply to the GND wire (black) of the EI-1034 and the negative terminal of the supply in series with a 100K resistor to the white wire of the EI-1034.

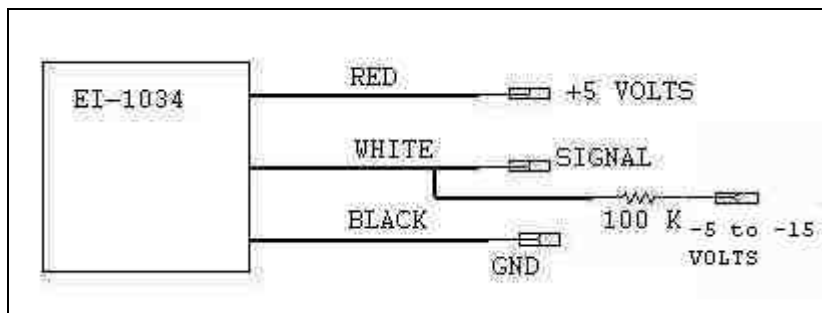

FIGURE 1

Specifications

Range with 0/5 volt supply: +10 to +300 °F (-12 to +150 °C) with the LabJack U12
0 to +300 °F (-17 to +150 °C) for the LabJack U3 or UE9

Output to LabJack or Meter: 10 mV per °F

Accuracy:

+/- 0.4°F Typical	Room Temperature
+/- 1°F Max	Room Temperature
+/- 2°F Max	0°F to 230°F
+/- 3°F Max	-40°F to 0°F
+/- 1°F Typical	-50 °F to 300 °F

Sensor device in probe: LM34CAZ

Cable length: 6 ft supplied max 25 ft user extended

Probe length: 6 in

Power: +4 to 35 VDC at 90 uA

Output Current: 10 mA

Note: When operating at voltages less than 5 Volts the maximum operating temperature is reduced, typically at 4 Volts supply the maximum temperature limit is 200 °F
